A Practical Guide to Reading Research Papers

YOUR PERSONAL RESEARCH WORKSPACE

Welcome to your quiet research space.

Reading a research paper is an active process. Start with a clear question, identify the central claim, and examine the evidence before accepting the conclusion. A useful note connects the author's ideas with your own research questions.

Connect Codex, then select a passage to translate automatically.

View the Chinese translation in the side panel.

1. Import your paper

Sign in to Codex for smart import. GPT reads the first three pages, identifies the title, authors and other details, then names your PDF. The original filename is retained. Review the details, add tags, and organize papers into topics.

2. Begin with the big picture

Read the title, abstract and conclusion first. Ask what problem the work addresses and why that problem matters. Use the table of contents or text search to locate the sections you need.

Read in English.
Think in your own words.

A bilingual companion for your reading.

3. Translate a passage

Select a word, sentence or paragraph. GPT translates it automatically in the side panel. Each new selection replaces the previous result. To keep it, explicitly save a bilingual note or add the word to your vocabulary.

Tap Shift to collect selections without translating yet, on one page or across several pages. Tap Shift again to turn collection off and translate immediately. Selection translations stay in this window; they are not saved to the cloud automatically.

4. Leave a trace of your thinking

Highlight a useful passage and add a comment. Record questions, assumptions and possible connections. Notes are linked to a page, making it easy to return to the original context.

Drafts sync to your cloud account. Press Save, or Ctrl / Command + Enter, to keep a note. Use the pen or add a text box directly on the PDF. Drag panel dividers to resize your workspace; double-click to reset.

A useful note asks:

- What is the main research question?
- How does the method differ from existing approaches?
- Which experiments support the claim?
- What are the limitations and open questions?
- How could I reproduce or extend this work?

Build a library of ideas, not just a folder of files.

Make knowledge your own.

5. Organize with intention

Create a research topic for a question you care about. Add a few meaningful tags to each paper, mark important papers as favorites, and use reading status to distinguish what you plan to read from what you have finished.

6. Ask, summarize and present

Ask GPT about a selected passage or a page range. Generate a structured reading summary or a presentation. Review its page citations, edit the slide content and download an editable PPTX with speaker notes. Check all claims against the original paper.

A few practical details

- PDF files, saved notes and reading progress are stored in the cloud.
- Use the left and right arrow keys to turn pages.
- Use the slash key in the library to focus the search field.
- Scanned documents can be read, but text selection requires a text layer.
- The original PDF can be downloaded from the reader toolbar.

Read. Reflect. Connect.

A home for your ideas.
